Summary

Software developer at NICSI with over a year of experience building and deploying backend applications for government departments. Over the past year I have moved deliberately towards DevOps, learning by building: CI/CD pipelines in Jenkins, GitOps deployments with ArgoCD on Kubernetes, and AWS infrastructure in Terraform. I am careful with production systems: I test changes before they go live and document my work so others can repeat it. Looking for a DevOps or Platform Engineer role where I can build and improve deployment pipelines and cloud infrastructure, and keep growing towards reliability engineering.

Technical Skills

Cloud	AWS (EC2, VPC, IAM, EKS, S3, DynamoDB, RDS, SNS)
CI/CD & GitOps	Jenkins, Jenkins Shared Libraries, SonarQube, ArgoCD, Git, GitHub
Containers	Docker, Kubernetes, Helm
Infrastructure as Code	Terraform (modules, remote state, state locking)
Monitoring & Cost	Grafana, Infracost, AWS SNS alerts
Linux & Scripting	RHEL, Ubuntu, systemd, Bash, Python
Backend & Databases	Laravel, React, REST APIs, MySQL, MariaDB, PostgreSQL

Professional Experience

Software Developer (Backend & Automation), NICSI

Aug 2025 – Present | Udaipur

- Deployed a React and Laravel application to a production RHEL 7.2 server that also runs a live XAMPP stack, without disrupting the existing services.
- Set up a test server on AWS EC2 matching production, tested the full deployment there first, wrote a deployment runbook, and configured the application to run as a systemd service.
- Working on the migration of a legacy works management system to React and Laravel, moving one module at a time (starting with login) while both systems share the same database.
- Wrote a Python script to move transaction data into three new tables, with checks comparing old and new records and batch IDs to undo incorrect Excel uploads.
- Automated an Excel-based reporting process, reducing preparation time from about 1 hour to 5 minutes, and replaced manual data entry with a bank API integration, removing a 2-day delay in transaction records.
- Integrated internal software with a state government portal API and added dashboards through a separate Python service, avoiding extra load on the legacy database.

Projects

CI/CD and GitOps Pipeline

github.com/saksham157/shared-pipeline-idp

Jenkins, SonarQube, Docker, Helm, ArgoCD, Kubernetes, Python

- Built a Jenkins Shared Library that gives any repository the same pipeline (tests, SonarQube scan, quality gate, Docker build and push, deployment update) through a two-line Jenkinsfile.
- Configured the SonarQube quality gate to stop the build before a Docker image is created when code quality checks fail.
- Set up GitOps delivery: Jenkins updates the image tag in a separate Helm repository and ArgoCD syncs it to Kubernetes, so Jenkins never needs access to the cluster.
- Fixed a CrashLoopBackOff, a Service port mismatch and a missing dependency in the Docker image while getting the app to run on the cluster.

Multi-Environment AWS Infrastructure

github.com/saksham157/cloud-native-terraform-platform

Terraform, AWS VPC, EKS, IAM, S3, DynamoDB

- Wrote reusable Terraform modules for the VPC, subnets, NAT gateway, security groups, IAM roles and an EKS cluster with a managed node group.
- Created dev, test and staging environments from the same modules, each with its own network range and state file.
- Stored Terraform state in an encrypted, versioned S3 bucket with DynamoDB locking, and gave Jenkins AWS access through an IRSA role instead of access keys.

Terraform Cost Tracking

Terraform, Infracost, Python, PostgreSQL, Grafana, Jenkins

- Built a pipeline that estimates the monthly cost of each Terraform plan with Infracost, stores the results in PostgreSQL and shows the cost trend in Grafana.

Education & Training

Cloud and DevOps Engineering Program, Intellipaat — Sep 2025 – Aug 2026

Coursework in Computer Applications (BCA), Mohanlal Sukhadia University — 2019 – 2021
